

7. The Recursion Theorem

- Main result in this section:
Kleene's Recursion Theorem.
 - Recursive functions are closed under a very general form of recursion.
- For proof we will use the **S-m-n-theorem**.
 - Used in many proofs in computability theory.

The S-m-n Theorem

$f : \mathbb{N}^{m+n} \rightrightarrows \mathbb{N}$ partial rec.
 $g(\vec{x}) \simeq f(\vec{l}, \vec{x})$.

- So there exists a primitive recursive function S_n^m s.t.,
 - if $f = \{e\}^{m+n}$,
 - then $g = \{S_n^m(e, \vec{l})\}^n$.

The S-m-n Theorem

- Assume $f : \mathbb{N}^{m+n} \rightrightarrows \mathbb{N}$ partial recursive.
- Fix the first m arguments (say $\vec{l} := l_0, \dots, l_{m-1}$).
- Then we obtain a partial recursive function

$$g : \mathbb{N}^n \rightrightarrows \mathbb{N}, \quad g(\vec{x}) \simeq f(\vec{l}, \vec{x}) .$$

- The S-m-n theorem expresses that we can compute a Kleene index of g
 - i.e. an e' s.t. $g = \{e'\}^n$
- from a Kleene index of f and \vec{l} **primitive recursively**.

Theorem 7.1 (S-m-n Theorem)

- Assume $m, n \in \mathbb{N}$.
- There exists a primitive recursive function

$$S_n^m : \mathbb{N}^{m+1} \rightarrow \mathbb{N}$$

s.t. for all $\vec{l} \in \mathbb{N}^m, \vec{x} \in \mathbb{N}^n$

$$\{S_n^m(e, \vec{l})\}^n(\vec{x}) \simeq \{e\}^{m+n}(\vec{l}, \vec{x}) .$$

Proof of S-m-n Theorem

- Let T be a TM encoded as e .
- A Turing machine T' corresponding to $S_n^m(e, \vec{l})$ should be s.t.

$$T'^n(\vec{x}) \simeq T^{n+m}(\vec{l}, \vec{x}) .$$

Proof of S-m-n Theorem

T is TM for e .

Want to define T' s.t. $T'^n(\vec{x}) \simeq T^{n+m}(\vec{l}, \vec{x})$

T' can be defined as follows:

1. The initial configuration is:

- \vec{x} written on the tape,
- head pointing to the left most bit:

Proof of S-m-n Theorem

T is TM for e .

Want to define T' s.t. $T'^n(\vec{x}) \simeq T^{n+m}(\vec{l}, \vec{x})$

Initial configuration:

- T' writes first binary representation of $\vec{l} = l_0, \dots, l_{n-1}$ in front of this.
 - terminates this step with the head pointing to the most significant bit of $\text{bin}(l_0)$.

So configuration after this step is:

Proof of S-m-n Theorem

T is TM for e .

Want to define T' s.t. $T'^n(\vec{x}) \simeq T^{n+m}(\vec{l}, \vec{x})$.

Configuration after first step:

- Then T' runs T , starting in this configuration. It terminates, if T terminates. The result is

$$\simeq T^{m+n}(\vec{l}, \vec{x}) ,$$

and we get therefore

$$T'^n(\vec{x}) \simeq T^{m+n}(\vec{l}, \vec{x})$$

as desired.

Proof of the S-m-n Theorem

T is TM for e .

T' is a TM s.t. $T'^m(\vec{x}) \simeq T^{n+m}(\vec{l}, \vec{x})$

- From a code for T one can now obtain a code for T' in a primitive recursive way.
- S_n^m is the corresponding function.
- The details will not be given in the lecture
[Jump over details](#)

Proof of the S-m-n Theorem

- A code for T' can be obtained from a code for T and from \vec{l} as follows:
 - One takes a Turing machine T'' , which writes the binary representations of

$$\vec{l} = l_0, \dots, l_{m-1}$$

in front of its initial position (separated by a blank and with a blank at the end), and terminates at the left most bit.

- It's a straightforward exercise to write a code for the instructions of such a Turing machine, depending on \vec{l} , and show that the function defining it is primitive recursive.

Proof of the S-m-n Theorem

- Assume, the terminating state of T'' has Gödel number (i.e. code) s , and that all other states have Gödel numbers $< s$.
- Then one appends to the instructions of T'' the instructions of T, but with the states shifted, so that the new initial state of T is the final state s of T'' (i.e. we add s to all the Gödel numbers of states occurring in T).
- This can be done as well primitive recursively.

Proof of the S-m-n Theorem

- So a code for T'' can be defined primitive recursively depending on a code e for T and \vec{l} , and S_n^m is the primitive recursive function computing this. With this function it follows now that, if e is a code for a TM, then

$$\{S_n^m(e, \vec{l})\}^n(\vec{x}) \simeq \{e\}^{n+m}(\vec{l}, \vec{x}) .$$

This equation holds, even if e is not a code for a TM: In this case $\{e\}^{m+n}$ interprets e as if it were the code for a valid TM T

Proof of the S-m-n Theorem

- (A code for such a valid TM is obtained by
 - deleting any instructions $\text{encode}(q, a, q', a', D)$ in e s.t. there exists an instruction $\text{encode}(q, a, q'', a'', D')$ occurring before it in the sequence e ,
 - and by replacing all directions > 1 by $\lceil R \rceil = 1$.)

Proof of the S-m-n Theorem

- $e' := S_n^m(e, \vec{l})$ will have the same deficiencies as e , but when applying the Kleene-brackets, it will be interpreted as a TM T' obtained from e' in the same way as we obtained T from e , and therefore

$$\{e'\}^n(\vec{x}) \simeq T'^n(\vec{x}) \simeq T^{n+m}(\vec{l}, \vec{x}) \simeq \{e\}^{n+m}(\vec{l}, \vec{x}) .$$

So we obtain the desired result in this case as well.

Notation

- We will in the following often omit the superscript n in $\{e\}^n(m_0, \dots, m_{n-1})$.
 - I.e. we will write

$$\{e\}(m_0, \dots, m_{n-1})$$

instead of

$$\{e\}^n(m_0, \dots, m_{n-1})$$

- Further $\{e\}$ not applied to arguments and without superscript means usually $\{e\}^1$.

Notation

- We introduce as well some notations for dealing with \vec{x} , \vec{y} etc.

$$\forall \vec{x} \in \mathbb{N}. \varphi(\vec{x})$$

stands for

$$\forall x_1, \dots, x_n \in \mathbb{N}. \varphi(x_1, \dots, x_n)$$

where the number of variables is implicit (and usually unimportant).

$$\exists \vec{x} \in \mathbb{N}. \varphi(\vec{x})$$

is to be understood similarly.

Notation

$$\{\vec{x} \in \mathbb{N}^n \mid \varphi(\vec{x})\}$$

is to be understood as

$$\{(x_1, \dots, x_n) \in \mathbb{N}^n \mid \varphi(x_1, \dots, x_n)\}$$

$$\{(\vec{x}, y, z) \in \mathbb{N}^n \mid \varphi(\vec{x}, y, z)\}$$

is to be understood as

$$\{(x_1, \dots, x_n, y, z) \in \mathbb{N}^n \mid \varphi(x_1, \dots, x_n, y, z)\}$$

- Similar notations are to be understood analogously.

Kleene's Recursion Theorem

- Assume $f : \mathbb{N}^{n+1} \rightarrow \mathbb{N}$ partial recursive.
- Then there exists an $e \in \mathbb{N}$ s.t.

$$\{e\}^n(\vec{x}) \simeq f(e, \vec{x}) .$$

(Here $\vec{x} = x_0, \dots, x_{n-1}$).

Examples

Kleene's Rec. Theorem: $\exists e. \forall \vec{x}. \{e\}^n(\vec{x}) \simeq f(e, \vec{x})$.

- There exists an e s.t.

$$\{e\}(x) \simeq e + 1 .$$

For showing this take in the Recursion Theorem

$$f(e, n) := e + 1 .$$

Then

$$\{e\}(x) \simeq f(e, x) \simeq e + 1 .$$

Examples

Kleene's Rec. Theorem: $\exists e. \forall \vec{x}. \{e\}^n(\vec{x}) \simeq f(e, \vec{x})$.

Remark:

- Such applications usually not very useful.
- Usually, when using the Rec. Theorem, one
 - doesn't use the index e directly,
 - but only the application of $\{e\}$ to arguments.

Examples

2. The function computing the **Fibonacci-numbers** fib is recursive.

- (This is a weaker result than what we obtained above –
- above we showed that it is even prim.-rec.)

Fibonacci Numbers

Remember the defining equations for fib:

$$\begin{aligned} \text{fib}(0) &= \text{fib}(1) = 1, \\ \text{fib}(n+2) &= \text{fib}(n) + \text{fib}(n+1). \end{aligned}$$

From these equations we obtain

$$\text{fib}(n) = \begin{cases} 1, & \text{if } n = 0 \text{ or } n = 1, \\ \text{fib}(n-2) + \text{fib}(n-1), & \text{otherwise.} \end{cases}$$

We show that there exists a recursive function $g : \mathbb{N} \rightarrow \mathbb{N}$, s.t.

$$g(n) \simeq \begin{cases} 1, & \text{if } n = 0 \text{ or } n = 1, \\ g(n-2) + g(n-1), & \text{otherwise.} \end{cases}$$

Fibonacci Numbers

Show: Exists g rec.

$$\text{s.t. } g(n) \simeq \begin{cases} 1, & \text{if } n = 0 \text{ or } n = 1, \\ g(n-2) + g(n-1), & \text{otherwise.} \end{cases}$$

Shown as follows: Define a recursive $f : \mathbb{N}^2 \rightarrow \mathbb{N}$ s.t.

$$f(e, n) \simeq \begin{cases} 1, & \text{if } n = 0 \text{ or } n = 1, \\ \{e\}(n-2) + \{e\}(n-1), & \text{otherwise.} \end{cases}$$

Now let e be s.t.

$$\{e\}(n) \simeq f(e, n).$$

Then e fulfils the equations

$$\{e\}(n) \simeq \begin{cases} 1, & \text{if } n = 0 \text{ or } n = 1, \\ \{e\}(n-2) + \{e\}(n-1), & \text{otherwise.} \end{cases}$$

Fibonacci Numbers

$$\{e\}(n) \simeq \begin{cases} 1, & \text{if } n = 0 \text{ or } n = 1, \\ \{e\}(n-2) + \{e\}(n-1), & \text{otherwise.} \end{cases}$$

Let $g = \{e\}$.
Then we get

$$g(n) \simeq \begin{cases} 1, & \text{if } n = 0 \text{ or } n = 1, \\ g(n-2) + g(n-1), & \text{otherwise.} \end{cases}$$

These are the defining equations for fib.

One can show by induction on n that $g(n) = \text{fib}(n)$ for all $n \in \mathbb{N}$.

Therefore fib is recursive.

General Applic. of Rec. Theorem

- Similarly, one can introduce arbitrary partial recursive functions g , where
 - $g(\vec{n})$ refers to arbitrary other values $g(\vec{m})$.
- This corresponds to the recursive definition of functions in programming.
E.g. in Java one defines

```
public static int fib(int n){
  if (n == 0 || n == 1){
    return 1;}
  else{
    return fib(n-1) + fib(n-2);}
};
```

Example 3

As in general programming, recursively defined functions need not be total:

- There exists a partial recursive function $g : \mathbb{N} \rightharpoonup \mathbb{N}$ s.t.

$$g(x) \simeq g(x) + 1 .$$

- We get $g(x) \uparrow$.
- The definition of g corresponds to the following Java definition:

```
public static int g(int n){
  return g(n) + 1;
};
```

- When executing $g(x)$, Java loops.

Example 4

- There exists a partial recursive function $g : \mathbb{N} \rightharpoonup \mathbb{N}$ s.t.

$$g(x) \simeq g(x + 1) + 1 .$$

Note that that's a "black hole recursion", which is not solvable by a total function.

- It is solved by $g(x) \uparrow$.
- Note that a recursion equation for a function f cannot always be solved by setting $f(x) \uparrow$.
 - E.g. the recursion equation for fib can't be solved by setting $\text{fib}(n) \uparrow$.

Ackermann Function

- The Ackermann function is recursive:
Remember the defining equations:

$$\begin{aligned} \text{Ack}(0, y) &= y + 1 , \\ \text{Ack}(x + 1, 0) &= \text{Ack}(x, 1) , \\ \text{Ack}(x + 1, y + 1) &= \text{Ack}(x, \text{Ack}(x + 1, y)) . \end{aligned}$$

- From this we obtain

$$\text{Ack}(x, y) = \begin{cases} y + 1, & \text{if } x = 0, \\ \text{Ack}(x - 1, 1), & \text{if } x > 0 \text{ and } y = 0 \\ \text{Ack}(x - 1, \text{Ack}(x, y - 1)), & \text{otherwise.} \end{cases}$$

Ackermann Function

$$\text{Ack}(x, y) = \begin{cases} y + 1, & \text{if } x = 0, \\ \text{Ack}(x - 1, 1), & \text{if } x > 0 \text{ and } y = 0, \\ \text{Ack}(x - 1, \text{Ack}(x, y - 1)), & \text{otherwise.} \end{cases}$$

- Define g partial recursive s.t.

$$g(x, y) \simeq \begin{cases} y + 1, & \text{if } x = 0, \\ g(x - 1, 1), & \text{if } x > 0 \wedge y = 0, \\ g(x - 1, g(x, y - 1)), & \text{if } x > 0 \wedge y > 0. \end{cases}$$

- g fulfils the defining equations of Ack.
- Proof that $g(x, y) \simeq \text{Ack}(x, y)$ follows by main induction on x , side-induction on y . The details will not be given in the lecture [Jump over details](#).

Proof of Correctness of Ack

Show $g(x + 1, y) = \text{Ack}(x + 1, y)$

- Base case $y = 0$:

$$g(x + 1, 0) \simeq g(x, 1) \stackrel{\text{Main-IH}}{=} \text{Ack}(x, 1) = \text{Ack}(x + 1, 0)$$

- Induction Step $y \rightarrow y + 1$:

$$g(x + 1, y + 1) \simeq g(x, g(x + 1, y))$$

$$\stackrel{\text{Main-IH}}{\simeq} g(x, \text{Ack}(x + 1, y))$$

$$\stackrel{\text{Side-IH}}{\simeq} \text{Ack}(x, \text{Ack}(x + 1, y))$$

$$= \text{Ack}(x + 1, y + 1)$$

Proof of Correctness of Ack

- We show by induction on x that $g(x, y)$ is defined and equal to $\text{Ack}(x, y)$ for all $x, y \in \mathbb{N}$:

- Base case $x = 0$.

$$g(0, y) = y + 1 = \text{Ack}(0, y)$$

- Induction Step $x \rightarrow x + 1$. Assume

$$g(x, y) = \text{Ack}(x, y)$$

We show

$$g(x + 1, y) = \text{Ack}(x + 1, y)$$

by side-induction on y :

Proof of the Rec. Theorem

Assume

$$f : \mathbb{N}^{n+1} \xrightarrow{\sim} \mathbb{N}$$

We have to find an e s.t.

$$\forall \vec{x} \in \mathbb{N}. \{e\}^n(\vec{x}) \simeq f(e, \vec{x})$$

Idea:

Define $e = S_n^1(e_1, e_2)$ for some (yet unknown) e_1, e_2 .

We get:

$$\{e\}^n(\vec{x}) \simeq \{S_n^1(e_1, e_2)\}^n(\vec{x}) \simeq \{e_1\}^{n+1}(e_2, \vec{x})$$

So we need to find e_1, e_2 s.t.

$$\forall \vec{x}. \underbrace{\{e_1\}^{n+1}(e_2, \vec{x})}_{\simeq \{e\}^n(\vec{x})} \simeq \underbrace{f(S_n^1(e_1, e_2), \vec{x})}_{\simeq f(e, \vec{x})}$$

Proof of Rec. Theorem

Need to solve:

$$\forall \vec{x}. \{e_1\}^{n+1}(e_2, \vec{x}) \simeq f(S_n^1(e_1, e_2), \vec{x}).$$

Let e_1 s.t.

$$\{e_1\}^{n+1}(y, \vec{x}) \simeq f(S_n^1(y, y), \vec{x}) .$$

So we need to solve

$$\underbrace{f(S_n^1(e_1, e_2), \vec{x})}_{\simeq \{e_1\}^{n+1}(e_2, \vec{x})} \simeq f(S_n^1(e_2, e_2), \vec{x}) .$$

Can be fulfilled by setting $e_2 := e_1$.

So, an index solving the problem is

$$e = S_n^1(e_1, e_2) = S_n^1(e_1, e_1) ,$$

and we are done.

Short Version of Proof

Let e_1 be s.t.

$$\{e_1\}^{n+1}(y, \vec{x}) \simeq f(S_n^1(y, y), \vec{x}) .$$

Let $e := S_n^1(e_1, e_1)$.

Then we have

$$\begin{aligned} \{e\}^n(\vec{x}) &= S_n^1(e_1, e_1) && \{S_n^1(e_1, e_1)\}^n(\vec{x}) \\ &\stackrel{\text{S-m-n theorem}}{\simeq} && \{e_1\}^{n+1}(e_1, \vec{x}) \\ &\stackrel{\text{Def of } e_1}{\simeq} && f(S_n^1(e_1, e_1), \vec{x}) \\ e = S_n^1(e_1, e_1) &\stackrel{\simeq}{=} && f(e, \vec{x}) . \end{aligned}$$
