WYSIWYG Systems

- What you type in can be seen directly on the screen.
- Microsoft Office Word is the main example of a WYSIWYG system.

Advantages/Disadvantages of WYSIWYG Systems

- WYSIWYG systems are relatively easy to use.
- In WYSIWYG systems typesetting to be done by the user.
  - Problem: most users are not professional type setters.
- In most systems (e.g. Word) you can see only the output, but not the formatting information.
  - Difficult to detect that one headline is in 11 pt and another in 12 pt, or one headline in one font, and another in a slightly different font.
  - Therefore output is usually inconsistent.
- Usually output not of printable quality.
- Programming is difficult, definition of macros restricted and difficult.

WYSIWYM

- WYSIWYM = “What You See Is What You Mean”.
- Instead of doing the typesetting directly the user says:
  - This is a headline.
  - This is a section title.
  - This text is normal text.
  - This is a mathematical formula
- Main examples: TeX and \LaTeX.
Advantages/Disadvantages of WYSIWYM Systems

- Steeper learning curve.
- Separation of output from input, therefore what you write needs to be compiled into text.
- Can create text in print quality.
  - Many publishers print articles typeset in \LaTeX\ directly, or after adding their own generic macros.
- User sees all formatting information and can therefore produce very uniform text.
- Programmable using macros.
  - Development of macro packages for many purposes.
    - In \LaTeX\ macro packages e.g. for chess, for typesetting proofs, chemical formulas exist.
    - These slides are typeset in \LaTeX\.

\LaTeX

- T\TeX\ developed by Donald Knuth in order to typeset a new version of his books “The art of Computer Programming”.
- \LaTeX\ (for Lamport-T\TeX) developed by Laslie Lamport in order to make a more user-friendly version of T\TeX.
  - \LaTeX\ is essentially a macro package on top of T\TeX.

Use of \LaTeX\ for Reports and Dissertation

- Reports and dissertations can be written using any text processing system.
- Use of \LaTeX\ will in many cases give you a slight advantage because of the higher quality of the output.
- Many lecturers (but not all) use \LaTeX, especially for scientific publishing.
  - They might help you with \LaTeX.

Example

- The following shows an example of \LaTeX\ code (split into 3 codes) plus the output.
- For ease of presentation after each code piece the final output (which is only produced after running \latex\ on the whole code) is shown.
- The source for this file is available from the webpage of CS-M00 or here: http://www.cs.swan.ac.uk/~csetzer/lectures/researchmethodology/11/exampleWikipedia.tex

CS_M00  Lecture 4: \LaTeX
9/28

Example (Continued)

\LaTeX{} is a document preparation system for the \TeX{} typesetting program. It offers programmable desktop publishing features and extensive facilities for automating most aspects of typesetting and desktop publishing, including numbering and cross-referencing, tables and figures, page layout, bibliographies, and much more.

\LaTeX{} was originally written in 1984 by Leslie Lamport and has become the dominant method for using \TeX; few people write in plain \TeX{} anymore. The current version is \LaTeXe. \LaTeX{} plays an important \role{} in publishing scientific articles in Science.

\% This is a comment; it will not be shown \% in the final output.

\LaTeXOutput

\LaTeX{} is a document preparation system for the \TeX{} typesetting program. It offers programmable desktop publishing features and extensive facilities for automating most aspects of typesetting and desktop publishing, including numbering and cross-referencing, tables and figures, page layout, bibliographies, and much more. \LaTeX{} was originally written in 1984 by Leslie Lamport and has become the dominant method for using \TeX{}; few people write in plain \TeX{} anymore. The current version is \LaTeXe. \LaTeX{} plays an important role in publishing scientific articles in Science.

\begin{equation}
E = mc^2
\end{equation}
\begin{equation}
\frac{m}{\sqrt{1 - \frac{v^2}{c^2}}}
\end{equation}

More Details

- \documentclass[12pt]{article}
  - Standard Header of a Latex file.
- \title{LaTeX}
  - Defines the title.
- \author{Anton Setzer}
  - Starts defining the author (note { not closed yet)

- \thanks{Dept. of Computer Science,
Swansea University, Singleton Park,
Swansea SA1 4PZ, UK.
Email: {tt a.g.setzer@swan.ac.uk}.
This article is based on the example in Wikipedia,
http://en.wikipedia.org/wiki/LaTeX}}
  - Footnote added to author.
  - {tt ··· } type sets this part in type writer font.
  - Second "}" finishes definition of author.
- \date{7 October 2011}
  - Defines the date.

- \newcommand{role}{\{r\`{o}le}\}
  - Defines a macro.
  - From now on \role will expand to \{r\`{o}le\}.
  - Curly brackets will be used to group text but will not be
printed.
  - \`{o} typesets ô
  - There are macros for defining lots and lots of special symbols.
  - http://www.tug.org/tex-archive/info/symbols/comprehensive/
  - Macros can have parameters as well.
\begin{document}
\maketitle

- \begin{document} \text{Start of the content of the document.}
- \maketitle \text{Puts title, author, date at this position.}
- Without this command no title, author, date will occur in the document.

LaTeX is a document preparation system for the \TeX typesetting program. It offers ...
- This is standard text to be typeset.
- Aligning the text done by the system.
- Line breaks in the text create only space between words.
- Double line breaks creates a paragraph (Equivalently one can use the macro \texttt{\par}).
- Several blanks, tabs, line breaks are the same as a single space (except for double line breaks).
- \TeX typesets $\TeX$

LaTeX plays an important \texttt{role} in publishing
- Here the user defined macro \texttt{role} typeset as rôle is used.
- \texttt{} here makes sure that there is a blank after \LaTeX and after rôle.
  Spaces after a macro are ignored.
- \% This is a comment; it will not be shown
  Everything in a a line after \% is a comment

\begin{align}
\end{align}

Example (Continued)

\begin{align}
\end{align}

- \begin{align} \text{Example of an environment.}
- \text{There are many environments in } \LaTeX.
Example (Continued)

\begin{align}
\cdots & \cdots \\
\cdots & \cdots \\
\end{align}

- Environment \texttt{align} typesets several formulae, which are numbered as (1), (2) consecutively.
- Content of an align environment is mathematical text.
  - \LaTeX{} and \TeX{} have a text mode and a formula mode.
  - In formula mode different macros (usually for creating mathematical text) are used.
  - In mathematical text all blanks are ignored.
  - Mathematical text is where the full power of \LaTeX/\TeX{} is shown.
  - Seems to be the easiest system for typesetting formulae.
- \texttt{\\} separates lines in mathematical text (can be used for ordinary text as well).
- Symbols & mark positions to be aligned.

\texttt{\textbackslash{begin\{align\}}}

\texttt{\textbackslash{end\{align\}}}

\texttt{\textbackslash{document}}

\LaTeX{} under Windows

- Use any texteditor. Recommended: Emacs or XEmacs.
- MikTeX is a \LaTeX{} compiler for Windows.
- For viewing dvi files use the included YAP dvi-viewer.
- For postscript use GhostScript + GSView.
- See for instance
  \url{http://www.pinteric.com/miktex.html} on how to use \LaTeX{} under Windows.

More Documentation

- Lots of documentation on \LaTeX{} (tutorials, userguides etc) available online.
- Links available on the module home page at
  \url{http://www.cs.swan.ac.uk/~csetzer/lectures/researchmethodology/12/index.html}
